

## Testing a SaaS (Software as a Service) Platform in an Agile World

SaaS (Software as a Service) products and applications are becoming more common in today's development Industry, especially as Cloud Computing becomes a household name pushed forward by software players such as Google, Microsoft, Apple, etc.

In contrast to regular Web-Based systems, SaaS applications require a different approach to testing than what we are used to from other more traditional projects. In some cases testing a SaaS system is simpler than testing a regular Web-based platforms, but in many others it is a lot more challenging and demanding. It's made even more interesting by the fact that many of the teams developing SaaS Applications are based Agile Development Methodologies.

In this webinar, Joel Montvelisky will provide an overview of the main areas to cover when testing a SaaS Application or Platform based on his own experience at PractiTest (a SaaS QA Management Platform developed by his company). He will give some insights into the type of approaches and ideas that work best, and will also talk about some of the tools and methodologies his team currently uses while testing PractiTest.

The seminar is aimed at Test Engineers, Test Leaders, QA Managers, Project Managers, Developers and Development Managers.

Please see below a link to the registration page.
